Important todos for optimization

Technical problems

5 pages have duplicate page titles	Very important!
5 pages have a duplicate meta description	Very important!
Problems with headings were found on 34 pages	Important!
29 pages have titles that are in need of improvement	Important!
2 pages have problems using strong or bold tags properly	Tip!

Sitestructure problems

2 pages compete with each other because of identical anchor texts.	Very important!
6 pages contain link anchors for internal links, which should be improved	Tip!

Content problems

2 problem/problems were found with pages, that compete with each other due to keyword optimization	Very important!
6 pages have duplicate content problems	Very important!
On 8 pages keywords from the title are not used in the page's text part.	Important!
On 3 pages some keywords from the H1 heading were not found in the page content	Important!
64 content/text blocks were found that are present on more than one page	Important!
On 6 pages only some paragraphs were found	Tip!
On 12 pages, text blocks are used several times	Tip!

Complete page duplicates	0	0

Pages with technical problems

Pages that could not be checked due to technical problems

No errors or problems were found.

Pages with problematic page titles

Problematic pages or page titles that require optimization

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the page titles on your website.

Why page titles are important for SEO:

The title of a web page (also known as the "meta title" or "title tag") is one of the most important elements for on-page search engine optimisation. Search engines such as Google analyse the title to understand the content of a page and use the information it contains for ranking purposes. In addition, the title is displayed as the most prominent element in search results and should encourage searchers to click on the "search snippet". If the title tag is missing on a page, or if the title does not meet Google's requirements, Google may generate its own title for the search results, which may lead to less ideal results.

What the notes in the "Problems" column mean:

- **Empty:** The title tag for this page contains no content.
- **Missing:** No title tag was found for this page.
- **Too short:** The page title is very short, wasting valuable optimization potential.
- **Only one word:** The page title consists of only 1 word, wasting valuable optimization potential.
- **Too long:** The page title is very long and is likely to be truncated in the search results.
- **Meaningless word:** The title gives no information about the content of the page.
- **Domain within the title:** The title contains only the domain name and gives no information about the content of the page.
- **Word repetition:** The title contains repeated words and could be interpreted as [keyword stuffing](#).

How to optimize your page titles:

- Length of 55 to 65 characters.
- Important keywords for the page should be used in the title.
- 2 to 3 keywords should be used in a logical context.
- The most important keywords should be located at the beginning of the title.
- The title of a page should not change too frequently.
- Each title should only appear once on the whole website.

You can find more optimization tips and information [in our wiki](#).

Tip: Use [Seobility's SERP snippet generator](#) to easily optimize the length of your page titles.

Problems with meta descriptions

Missing or bad meta descriptions.

Optimization Tips

Video tutorial included ►

This analysis shows you pages with [meta description](#) problems.

Why meta descriptions are important for SEO:

Although a page's meta description doesn't directly affect the ranking of the page, it's an important element for SEO because it's displayed in the search results snippet in the [SERPs](#). It should encourage searchers to click on your snippet as it is the first contact they have with your website. For this reason, you should write an engaging meta description for each relevant page of your site.

If there's no meta description, or if Google thinks your description is not relevant enough, Google will usually display a text snippet from the page that contains the terms that a user was searching for.

What the notes in the "Problems" column mean:

- **Missing:** No meta description was found on the page.
- **Empty:** The meta description tag for this page contains no content.
- **Too short:** The page's meta description is very short and leaves room for optimization.
- **Only one word:** The meta description consists of only one word and leaves room for optimization.
- **Multiple:** Multiple meta descriptions were found on the page.
- **Too long:** The meta description is very long and is likely to be truncated in the search results.

How to optimize your meta descriptions:

- Keep to a maximum length of around 1000 pixels (**Tip:** You can easily optimize the length of your meta descriptions with the [SERP Snippet Generator from Seobility](#)).
- Provide a description of the page content that is as precise and understandable as possible and that encourages users to take action ("buy", "inform", "compare", "download", etc.).
- Avoid very general descriptions that reveal little about the content of the page.
- Use keywords that are relevant to the page. These will appear in bold in the snippet for relevant searches, highlighting the relevance of your results.
- Avoid [keyword stuffing](#).
- Create a unique meta description for each relevant page.

You can find a full guide to optimizing your meta descriptions [on our blog](#).

How to set a meta description in the most popular content management systems:

#	URL	Problems	Meta description
1.	https://www.chefaugustin.com/recipes/cluster/chicken-dinners-for-two	Too long	Practical chicken recipes perfectly portioned for two people. Quick weeknight dinners, sheet-pan meals, and stir-fries that make cooking for a small household effortless. 1033 / 1000 Pixels

Duplicate page titles

Page titles that are used on several pages

Optimization Tips

This is a list of page titles used for more than one page on your website.

Why each page of your website should have a unique page title:

The title of a web page (also known as the "[meta title](#)" or "title tag") is one of the most important elements for on-page SEO. Search engines such as Google analyze the title to understand the content of a page and use the information it contains for ranking purposes.

Therefore, the title should reflect the page content as accurately as possible and be unique for each page. If you are using the same page title for a number of pages, it is likely that the title is not informative enough, or that it does not match the content of each page. This means that you are giving away valuable optimization potential, as all these pages will inevitably be optimized for the same keywords due to the identical title. With a unique title, they may have the potential to rank for other, more differentiated keywords that better match the content of each page.

Common reasons for duplicate page titles:

- Duplicate pages ([duplicate content](#))
- A page is accessible from multiple URLs and has no [canonical link](#) to the original page (e.g. pages with [parameters](#) in the URL).
- You are using a standard title for a number of sub-pages.
- You describe several pages with the same title, such as the home page and your company description.

How to fix these issues:

If the duplicate page title is due to duplicate content, you need to find out how this is caused. In many cases, you will be able to fix the problem by adding a [canonical tag](#) to the duplicate pages. See the duplicate content analyses in the "Content" section for more information.

In all other cases, you will need to define a unique page title for each of the URLs in question. You can find tips on how to optimize your page titles [in our wiki](#).

How to edit the page title in the most popular content management systems:

- [Instructions for WordPress](#)
- [Instructions for Shopify](#)
- [Instructions for Wix](#)

Duplicate meta descriptions

Meta descriptions that are used on several pages

Optimization Tips

This is an overview of [meta descriptions](#) that are used for multiple pages of your website.

Why each relevant page should have a unique meta description:

Although a page's meta description doesn't directly affect the ranking of the page, it's an important element for SEO because it's displayed in the search results snippet in the [SERPs](#). It should encourage searchers to click on your snippet as it is the first contact they have with your website. For this reason, you should provide a description for each relevant page that is as precise as possible and that matches the content of the page.

Common reasons for duplicate meta descriptions:

- Duplicate pages ([duplicate content](#))
- A page is accessible from multiple URLs and has no [canonical link](#) to the original page (e.g. pages with [parameters](#) in the URL).
- You are using a standard description for several pages.

How to fix these problems:

If the duplicate meta descriptions are caused by duplicate content, you should find out how this is created. In many cases, you will be able to fix the problem by adding a [canonical tag](#) to the duplicate pages. For more information, see the duplicate content analyses in the "Content" section.

In all other cases, you should write a unique meta description for each affected URL. On our blog, we explain [how to write the perfect SEO meta description](#) step-by-step.

If your site is very large and it would be too time-consuming to create a good and unique description for each page, you can work with templates for less important pages. [Our blog post](#) explains how to do this as well.

How to edit the meta description in the most popular content management systems:

- [Instructions for WordPress](#)
- [Instructions for Shopify](#)
- [Instructions for Wix](#)
- [Instructions for Squarespace](#)

Problems with H1 headings

Problematic H1 headings

Optimization Tips

☐ Video tutorial included ►

This analysis will show you if there are problems with the H1 headings on your website.

Why H1 headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines when analyzing the page content.

Generally, there is a hierarchical structure of headings from H1 to H6. The H1 heading is the most important heading and should summarize the entire content of a page. It should be as specific and informative as possible, and include the most important keywords.

What the notes in the "Problems" column mean:

- **Missing:** No H1 heading was found on the page.
- **Empty:** The H1 tag contains no content.
- **Too short:** The content of the H1 tag is very short (e.g. two very short words) and may not be informative enough.
- **Only one word:** The H1 tag contains only one word and may not be informative enough.
- **Too long:** The content of the H1 tag is very long (more than 120 characters). Keep your headings as short and clear as possible.
- **Unimportant words:** The content of the H1 tag is very general (e.g. "Welcome") and does not provide information about the specific content of the page.
- **Too many:** The page contains more than one H1 heading, indicating that the structure needs improvement. Ideally, only one H1 should be used.

How to use H1 headings correctly:

- Only one H1 heading should be used on each page. Although Google is capable of handling multiple H1 headings, we recommend that you implement a clear hierarchical heading structure with a single main heading. This will keep the page clear for your visitors too.
- The heading in the H1 tag should match the page content and contain relevant keywords.
- The H1 heading should summarise the content of the page concisely and should not be too long.
- In general, headings should only be used to structure content and not for navigation elements, links, etc.

For more tips and information on optimizing your H1 headings, [see our wiki](#).

Problems with headings

Pages with problematic headings or problems within the heading structure

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where Seobility detected problems with headings.

Why headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines when analyzing the page content.

Generally, there is a hierarchical structure of headings [from H1 to H6](#), which can be compared to the hierarchy of headings in a regular text document. You should follow this hierarchy as far as possible to make your pages clearer for both search engines and visitors.

What the notes in the "Problems" column mean:

- **Empty heading:** The page contains empty heading tags.
- **Structural problem:** There is an error in the heading hierarchy, such as gaps in the hierarchy (e.g. H1 > H2 > H4) or errors in the order (e.g. H1 > H3 > H2).
- **Duplicate heading:** The page contains multiple headings with the same content.
- **Missing:** No headings were found on the page. You should add headings to structure the content.
- **Too many headings:** The page contains many heading tags. Check that their number is appropriate to the amount of text.

Click "Details" for more information about which specific headings on a page are affected by a problem.

How to use headings correctly:

- Headings should always be informative and reflect the content of the following section of text. Ideally, they should also contain important keywords.
- The number of headings should be reasonable in relation to the amount of text.
- To structure a paragraph more granularly, always use the next lower hierarchy level without jumps (after H1 comes H2, etc.).
- Headings should be neither too short nor too long.
- Use headings only to structure content and not for navigation elements, links or surrounding layout (e.g. contact forms, widgets, etc.). When in doubt, ask yourself if the heading you are using is related to the content of the page. If not, do not format it as a heading.

You can find more tips and information on how to optimize your headings [in our wiki](#).

Problems with strong and bold tags

Check of strong and bold tags finding too short, too long and duplicate tags.

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where problems with strong and bold tags were detected.

What are strong and bold tags and what are they used for?

The tags `<strong>` and `<b>` are used to highlight important words or statements in a text. Both tags cause the text they contain to be displayed in bold. Unlike the bold tag, the strong tag also marks up the text as "semantically important".

The tags are a good way of making users aware of important elements and text sections on a page. From an SEO perspective, however, they do not offer much room for optimization. You just want to avoid using them too much, as this could give the impression to search engines that the page is over-optimized and unnatural.

What the notes in the "Problems" column mean:

- **Many tags:** A large number of strong or bold tags have been found on the page. Check that their number is appropriate to the amount of text.
- **Empty tags:** Empty strong or bold tags were found on the page. You should remove these from the HTML code.
- **Too long:** The text marked up with bold or strong tags is longer than 70 characters. Check if you can reduce the length.
- **Duplicate:** The same words are marked up with bold or strong several times.

The video tutorial above will show you how to find the problematic tags on your site.

How to use strong and bold tags correctly:

- Use the strong tag instead of bold to emphasize important text. Unlike bold, the strong tag is not just a layout element.
- Ideally, you should only use these tags to emphasise small chunks of text of up to 70 characters (rather than long strings of text).
- The number of visual highlights should be appropriate to the total amount of text.

You can find more tips on the correct use of strong and bold tags [in our wiki](#).

Pages that are encrypted for transport via https, but contain insecure content such as images, etc.

No errors or problems were found.

Issues with file sources

Used files that have problems

No errors or problems were found.

Too many files within a page

Pages with too many included files

No errors or problems were found.

Medium response time

Pages that have a medium response time

Optimization Tips

The URLs in this list had an average server response time (between 0.5 and 1 second) when your website was crawled by Seobility.

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

Learn more about how to optimize server response time and page loading time:

- [Page Speed: What it is and how to improve it - Seobility Wiki](#)
- [39 Page Speed Optimization Tips - Seobility Blog](#)

#	URL	Response time in seconds	Difference to the average response time
1.	https://www.chefaugustin.com/recipes/dinner-for-two-recipes-healthy	0.51858	225%
2.	https://www.chefaugustin.com/recipes/easy-and-healthy-dinner-recipes-for-two	0.94782	412%

Slow response time

Pages that are slower than the average or even exceed the acceptable response time limit. Only the HTML page response time is checked.

Optimization Tips

The URLs in this list had a slow server response time when your website was crawled by Seobility (compared to the average response time of your pages).

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "[page speed](#)") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

What to do in case of long response times:

One of the most frequent solutions for long response times is to check if [caching](#) and preloading are enabled on your server. Caching ensures that the server always has the content of your pages "at hand". This allows the server to respond more quickly to requests.

Please note: If you experience long response times in one crawl, and then see a significant improvement in a second crawl (without having changed anything), this is usually due to the server cache being filled in the first crawl and then being ready for the second crawl. Therefore, make sure that your server cache is already filled **before** you crawl your website with Seobility to avoid such fluctuations in the results of this analysis.

Internal link anchor texts that need improvement

Link anchors that can be improved

Optimization Tips

Video tutorial included ►

Here you will find pages that are internally linked with [link texts](#) that need improvement.

Why link text is important for SEO:

A link's anchor text is a very important element from an SEO perspective, as it tells search engines what the linked page is about. Ideally, it should contain the [keyword](#) for which the linked page (target page) is intended to rank. Link texts offer great potential for optimization, especially for internal links. This is because the frequent use of [exact-match" keyword link texts](#) is usually not penalized (unlike the use of such link texts for [backlinks](#)).

What the notes in the "Problems" column mean:

- **Link text to page is empty:** There are internal links pointing to the page with an empty link text.
- **Link anchor text is trivial:** The link text that is used to link to the page says nothing about the content of the page. (Typical examples are link text such as "here", "read more" or "read the article").
- **Link anchor text too long:** The text linking to the page is over 120 characters and should be shortened.
- **The link contains an image but has no alt-attribute:** The link to the page is not a regular text link, but is an image link. For such image links, search engines use the [ALT attribute](#) instead of the link text to learn about the linked page. However, when this error occurs, the image has no ALT attribute.

By clicking "Details", you can find out which page contains the link text that needs improvement.

How to optimize your link texts:

- The link text should provide a short, but still meaningful, description of the content of the page being linked to.
- Ideally, the link text should contain the keyword for which you want the linked page to be ranked.
- You should always provide a link text for a text link and an ALT attribute for an image link.

You can find more detailed instructions on how to optimize your internal links, including the link text, in our [internal linking guide](#).

#	Linked page	Problems

Identical anchor text for different pages

Link anchors that are used for different pages

Optimization Tips

Video tutorial included ►

The anchor texts in this list are used for several different link targets on your website.

Why you should not use identical anchor texts for different pages (link targets):

The purpose of [anchor texts](#) is to tell visitors and search engines what the linked page is all about. Therefore, they should be informative and include [keywords](#) that are relevant to the linked page.

If the same anchor texts are used for different link targets, there will be an overlap, as this signals to search engines that several pages are about the same topic. This can lead to "[keyword cannibalization](#)". You are also missing out on the opportunity to optimize the pages for more specific keywords by using unique anchor texts.

In general, you should also avoid trivial anchor texts such as "show more" or "read more", as these also don't make use of the optimization opportunities that anchor texts offer.

You can find more information about optimizing anchor texts [in our wiki](#).

How to fix the problems in this list:

In the column "URLs linked with this anchor text", you will find all URLs that are linked with a specific (identical) anchor text. Think about which unique anchor texts you could use instead to link to these pages.

Click on "Details" to find out on which pages the identical anchor text is used and change it accordingly.

Redirects

Internal redirects that have been linked

Optimization Tips

Video tutorial included ►

This list includes internally linked URLs that redirect to another URL on your website via a server-side [redirect](#) (status code 301).

Why you should avoid having internal links to redirecting URLs:

301 redirects are a good option if you need to change the URL of a page, or if you want to redirect multiple URLs to a single URL. However, for internal links, it is best not to link to a URL that redirects to another URL. Instead you should link directly to the destination of the redirect. This will avoid any errors if you decide to remove the redirect at some point.

Search engines like Google do follow your redirects (even if you have multiple redirects in a row), but if you use a lot of redirects, you are unnecessarily wasting the [crawling resources of the search engine bots](#). This keeps the bots busy following your redirects rather than crawling your actual page content. It can also increase [page load time](#) as each redirect requires a new request to be sent to the website server.

You can find more information about redirects [in our wiki](#) and [on the Google Search Central page](#).

What the information in this list means:

The left column ("Start URL of the redirect") shows the redirecting URL and (below it) the destination URL. The "Pages that link to a redirect" column lists all the pages that have a link pointing to the redirecting URL. If the link is located in a [canonical tag](#), [alternate link](#) or similar, you will see a note saying "Linked via canonical link, alternate link or similar".

How to fix internal redirects:

Change the links on the linking pages to point directly to the redirect's destination URL.

By clicking on the redirecting URL, you can see more details about where these links are located.

Canonical links that refer to broken links

No errors or problems were found.

Alternate link errors

Problems with alternate links (links to specify alternative language or country versions of a page)

No errors or problems were found.

Pages with only a few paragraphs

Pages with little text or few paragraphs

Optimization Tips

The pages in this list contain less than three paragraphs of text.

Why you should break up your content into clear paragraphs:

To make text easier to read and understand, it is very helpful to break it up into paragraphs. This makes it easier for visitors to understand your content. It also increases the likelihood that they will spend more time on your pages.

What does Seobility define as a "text block"?

A "text block" is a coherent text section that contains at least 100 characters and is enclosed by HTML structural elements such as <p> or <div>. Headings or lists are not counted as text blocks.

How to solve these problems:

In addition to the number of paragraphs that were found, the "Number of words" column will show you how long the content of the page is in total. If the word count is high, you should structure the text in a better way. Use headings, teasers, paragraphs and subheadings to break up the text.

On the other hand, if there is little text content on the page, there may be room to expand the content.

Note: For pages with image galleries, result lists, and similar content that does not require long/structured text, you can ignore the warnings.

Pages with little text

Pages that contain only very little text

Optimization Tips

The pages in this list contain less than 500 words.

Why pages with little text can be problematic:

A text that is too short is problematic if the subject or the keyword of the page requires detailed and extensive information. If your competitors are offering better and more comprehensive content on the same topic, you're going to struggle to rank with short content.

However, it is not necessarily a problem to have pages with little text. If the pages are e.g. image galleries, landing pages, etc., it is perfectly fine to use very little text.

In addition, there are times when search engine users are in need of a quick and concise answer to a particular search query, and a long and lengthy text page is not the answer. In this case, long and detailed text may deter visitors.

How you should treat these pages:

Before you make any changes to the content of a page, you should first check whether the topic or target keyword of the page requires extensive content or not. You can do this by analyzing the current top 10 search results. With the [free TF*IDF tool provided by Seobility](#), you can easily check the number of words on these pages.

If you find that the content of your page is in fact too short, you can try to expand it. Think about what kind of information your target audience needs in order to fulfil their [search intent](#). However, you'll want to avoid writing long texts that are just designed to boost SEO. Most importantly, your content should add value to your visitors.

Pages with duplicate paragraphs

Paragraphs that are repeated on a page

Optimization Tips

Video tutorial included ►

This analysis checks for pages where paragraphs of text are used repeatedly.

Why you should avoid duplicate text paragraphs on a page:

High-quality, interesting content that provides real value to visitors is one of the most important factors for a good ranking on Google. It is not a sign of quality content and good page design if the same paragraph is repeated several times on a page. Therefore, it is a good idea to remove duplicate paragraphs from your pages.

How to identify the duplicate paragraphs:

If you click on the red label in the "Number" column, you will get an overview of all the paragraphs that have been found on the page in question. For each paragraph, you can see how many times it is used on the page and how many times on the whole website.

Special case: cookie banners

Cookie banners displayed on all subpages of a website are not problematic from an SEO perspective and are therefore automatically recognized by Seobility and ignored in the analysis. However, to be safe, you can add the `"data-nosnippet"` attribute to your cookie banner. This will ensure that Seobility does not analyze this part of the HTML code. Google also recommends using this attribute if you want certain parts of a page's HTML code to be ignored and not displayed in the search result snippet.

Pages using keywords in page title but not in its body text

Pages with keywords in the title tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the page title do not appear in the actual content of the page.

Why titles and content should be consistent:

The [page title](#) is one of the most important on-page SEO elements and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in the title, with the most important keyword at the very beginning. To ensure consistency between title and content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's page title. The words in the title that do not appear in the content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the page title matches the actual content of the page, and vice versa.

If the title contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the title is not, then you should optimize the title and include important keywords for the page there.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.

Pages using keywords in H1 heading but not in its body text

Pages with keywords in the H1 tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the H1 heading do not appear in the text content of the page.

Why H1 headings and content should be consistent:

The [H1 heading](#) is an important on-page SEO element and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in this heading. To ensure consistency between the H1 heading and the content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's H1 heading. The words in the heading that do not appear in the text content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the H1 heading matches the text content of the page, and vice versa.

If the H1 contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the H1 is not, then you should optimize the H1 and include important keywords for the page there.

Ensure that the H1 heading differs from the [page title](#). Both elements should be unique.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.

Pages with very much text

Pages that contain a lot of text and might be divided into several pages

No errors or problems were found.

Pages with typos

Page content contains typos

No errors or problems were found.

Pages with filler text and images

Pages with filler texts or images

No errors or problems were found.

Content that appears on several pages

Content/text that is used on more than one page

Optimization Tips

Here you will find an overview of text blocks that are used on several pages of your website.

For this analysis, each text block found on your website is normalized and saved. If the same text block appears on several pages, it is detected and displayed here.

Notes, disclaimers, etc. that appear on a large number of your pages will not be taken into account.

Why you should avoid using duplicate text blocks:

Each page should be unique and tailored to its target [keyword](#). This will ensure that the content is as relevant as possible. That's why you should avoid using duplicate text blocks or generic content.

If very long text blocks are used multiple times on your website, you may also run into problems with [duplicate content](#). For example, if you use long snippets of blog posts on the category pages or the home page of your blog, this could have a negative effect on the rankings of the actual blog posts. This is because Google has to decide which of these pages should appear in the search results if both a category page and a blog post contain relevant content for a keyword. As a consequence, it may choose the wrong one.

How to fix these problems:

As a general rule, you should avoid using generic text that is used on multiple pages. Create unique content for each subpage instead.

To avoid duplicate content problems, keep the preview text of blog articles or similar as short as possible.

Duplicate Content

Pages whose complete content appears on other pages

Optimization Tips

Here you will find a list of pages whose content was also found on other pages of your website (=duplicate content).

Why you should avoid duplicate content:

Duplicate content is very problematic from an SEO perspective and should be avoided at all costs. If you have a number of pages with the same content, search engines such as Google have to decide which of these URLs is the most relevant for the keyword in question and should be displayed in the search results. As a result, it may happen that the "wrong" URL is selected. In addition, duplicate URLs can spread positive ranking signals such as [backlinks](#) across the different URLs. This can cause the individual pages to rank lower than if these signals were consolidated on one URL.

This analysis checks for the following types of duplicate content:

This duplicate content check refers to duplicate content **within** your website, i.e. it does not analyze whether the content is used on any other website in the world wide web.

The following types of duplicate content can be detected:

- **Page duplicates:** The content of one page is identical to the content of another page. In these cases, the URLs are labelled "duplicate". This does not require a 100% match of the pages, but only of their body text. There may be differences in other elements such as the page title.
- **Included pages:** The content of page A is fully contained within the content of page B, but page B also contains additional content. This is indicated by the label "Included" next to the URL of the included page.

How to fix these problems:

Duplicate content is usually a technical problem or a problem with your content management. It is unlikely that you have deliberately written the same text twice.

In order to fix the problem, you will first need to find out what is causing the duplicate URLs. The most common causes of duplicate pages are:

- Your pages can be accessed **both with and without the "www." in the URL**. From a technical point of view, this creates duplicate content, as the same content can be found under two URLs. You can solve this problem by setting up a site-wide 301 redirect to the preferred URL variant. You can find more information on how to do this [in our wiki](#).
- **URL parameters**, e.g. for sorting products on shop category pages. These change the order of the products displayed. However, the content of the pages remains the same. You can solve this problem by adding a [canonical tag](#) to the URL variants with parameters. This tag should link to the "original" variant without parameters.
- **Categories or tags** are not distinctive enough and return the same results. In order to avoid this, you should only use tags and categories that are clearly differentiated in terms of content and that have as little overlap as possible.

Common causes of included pages:

- Blogs **display the full article content on category pages** or the homepage. In this case, you should only use a very short snippet of the text content as the preview text.

Other causes of duplicate content, solutions, and ways to avoid can be found [in this blog post](#).

Competing pages for the same keywords

Competing pages due to the same keyword optimization

Optimization Tips

This analysis indicates if there are pages on your website that are optimized for the same keywords and that compete with each other in terms of rankings.

Why you should not have multiple pages optimized for the same keyword:

Search engines such as Google will usually only return one result per website/domain for any given search query. If you have multiple pages optimized for the same keyword, then these pages will be in competition with each other and hinder each other's rankings. This is known as "[keyword cannibalization](#)".

How Seobility identifies competing pages:

Seobility analyzes the content of each of your pages and determines the most important keywords and keyword combinations for each page. If two pages are well-optimized for the same keywords or if there is a large overlap between the optimized keywords, they will be listed here.

How to fix these problems:

If you have more than one page on the same topic on your website, this is a classic case of keyword cannibalization. There are a number of possible solutions that can solve this problem:

- Merge the content of the pages into a single page.
- Add some unique content to both pages to make them stand out from each other and to optimize them for more specific keywords.
- Redirect one of the URLs to the other URL.

Which of these approaches is the best one will depend on the individual case.

Note: This analysis may also display cases of [duplicate content](#) if the pages were not classified as duplicates due to small differences in the text. In this case, the recommendations for duplicate content apply. (See the "Duplicate content" analysis.)

In addition, it is also possible that pages are listed which contain only a small amount of content and have the same page titles or headings. In this case, we're not talking about "keyword cannibalization" but about "[thin content](#)". If you have pages like this, you should check whether you really need them and add more content to them if necessary.
